Jones CM. JAMA 2013

# Top 20 most commonly reported drugs in the ED in Europe

(n=8709 in 5529 presentations)

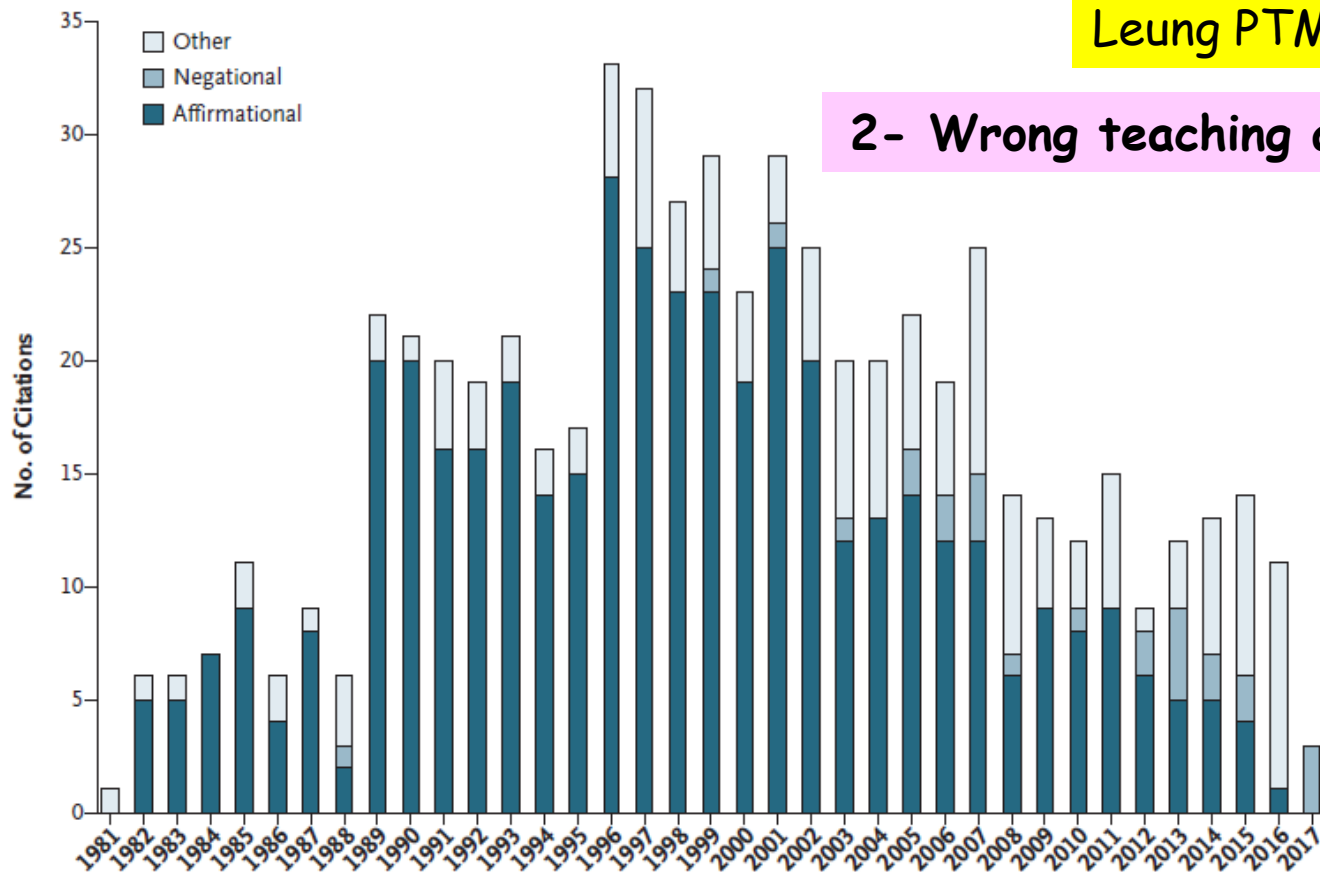

# The US Opioid-Overdose Epidemic

## Opioid sales, admissions for opioid-abuse treatment and deaths due to opioid overdose, 1999-2010

# A 1980 NEJM letter on the risk of opioid addiction when prescribed for chronic pain

A 5-sentence letter published in the NEJM in 1980 was uncritically cited as evidence that addiction was rare with long-term opioid therapy [439/608 (72%)]

Leung PTM. NEJM 2017

2- Wrong teaching and knowledge

# Opioid-prescribing patterns of emergency physicians and risk of long-term use

- Rates of opioid prescribing varies widely between low-intensity and high-intensity prescribers (7.3% vs. 24.1%).

- Long-term opioid use is higher among patients treated by high-intensity prescribers than among patients treated by low-intensity prescribers (adjusted OR, 1.30 [1.23 to 1.37];  $P < 0.001$ )

3- Inadequate prescriptions

Barnett ML. NEJM 2017

Trefentanil (38)

Mirfentanyl (72)

Vardanyan RS. *Future Med Chem* 2014

# Presentation of illicitly produced designer fentanyls

25 mg butyrfentanyl labeled bottles, each spray yields 0.25 mg and the content is sufficient for 95-105 puffs.

# The usual presentation of opioid overdose

1. Respiratory depression
2. Miosis
3. Stupor
4. Hepatic injury from acetaminophen or hypoxemia
5. Myoglobinuric renal failure
6. Rhabdomyolysis
7. Absent or hypoactive bowel sounds
8. Compartment syndrome
9. Hypothermia
10. Possible presence of one or more fentanyl patches

All opioids produce a similar toxidrome in excessive dosing.

SpO<sub>2</sub> and RR are surrogate indicators of ventilatory drive but provide limited information on drug-related effects on ventilatory control

PaCO<sub>2</sub> and V<sub>M</sub> are direct measures of ventilation but difficult to assess continuously

Boyer EW. NEJM 2012

# Intoxications involving acrylfentanyl - the Swedish STRIDA project -

## Risk of death from opioid overdose in relation to the treatment duration

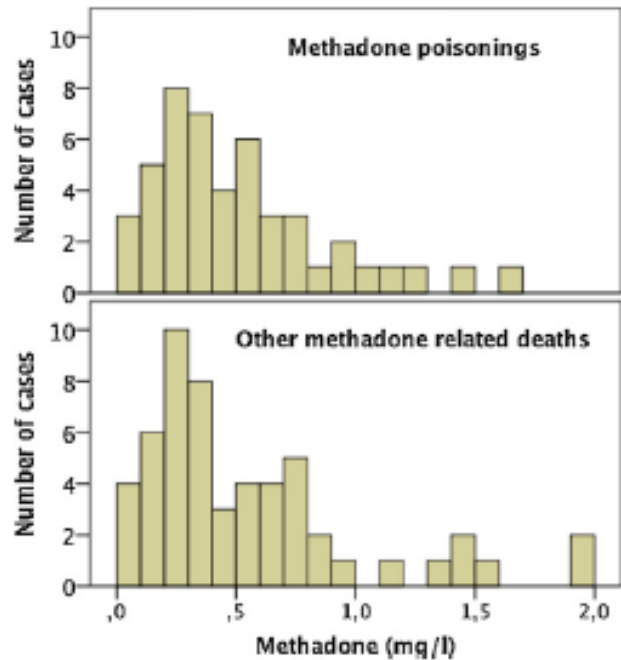

AGO graph from Massachusetts Department of Public Health data

# Risk factors for severe respiratory depression from prescription opioid overdose

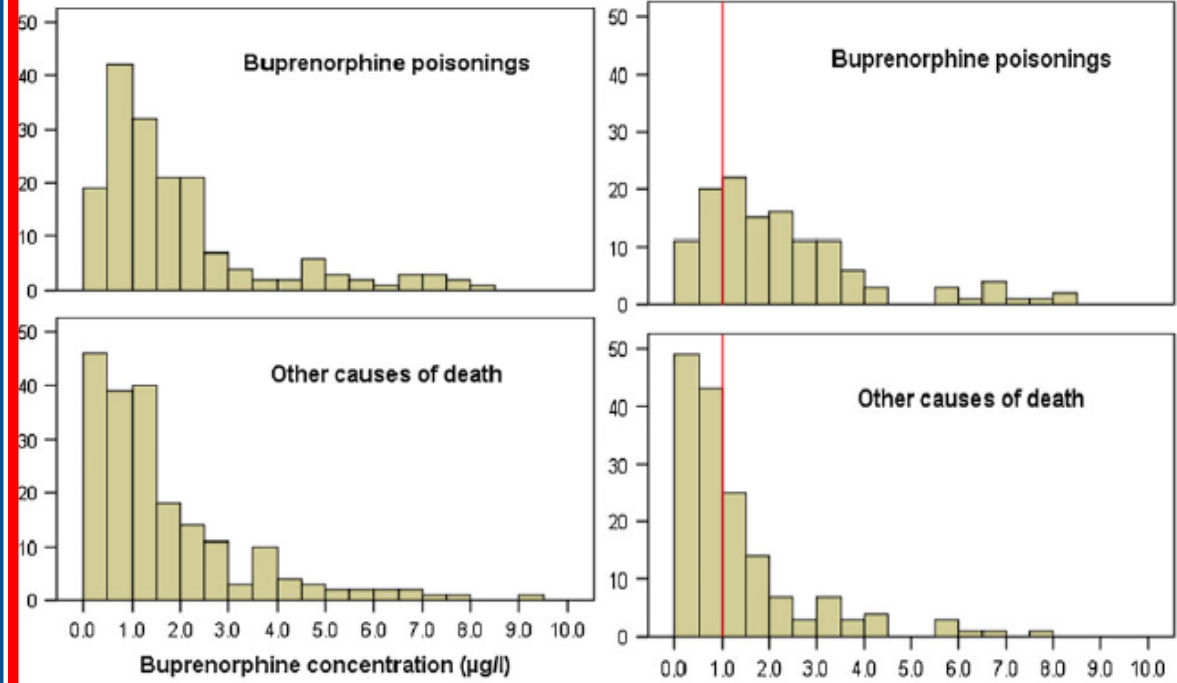

<i>Prescription opioid</i>	<i>SRD rate (%)</i>	<i>RR (descending)</i>	<i>95% CI</i>
Tapentadol	2/2 (100)	27.0	3.9–185
Fentanyl	5/6 (83.3)	22.5	3.2–159
Oxymorphone	2/3 (66.7)	18.0	2.2–144
Methadone	59/116 (50.9)	13.7	2.0–95
Hydromorphone	4/9 (44.4)	12.0	1.5–94
Morphine	5/12 (41.7)	11.3	1.5–86
Oxycodone	40/124 (32.3)	8.7	1.3–60
Hydrocodone	9/31 (29.0)	7.8	1.0–58
Buprenorphine	2/7 (28.6)	7.7	0.8–73
Tramadol	3/12 (25.0)	6.8	0.8–58
Codeine	1/27 (3.7)	1.0 (ref)	–

# Opioid-attributed death: role of the dose?

Methadone-related deaths

Häkkinen M. *Forensic Sci Int* 2012

Buprenorphine-related deaths

Häkkinen M. *Eur J Clin Pharmacol* 2011

# Could chest wall rigidity be a factor in the rapid death from illicit fentanyl abuse?

(N= 48)

Acute chest wall rigidity is a well-recognized complication

1- Deaths occurred with fentanyl in the therapeutic range (1-2 ng/ml) in apparent non-naive opiate abusers

questioning the onset of dose-dependent respiratory arrest as mechanism of death

2- Lack of measurable norfentanyl in half of the cases despite high fentanyl  
- No correlation between elevated fentanyl and rises in norfentanyl

suggesting a very rapid death, consistent with acute chest rigidity

# Drug-drug interactions

Abundance of hypnotics and drugs of abuse in blood (black) and proximal hair segments (white) in 99 methadone-related fatalities.

Based on segmental hair analysis, continuous exposure of methadone suggested that reduced tolerance of methadone is not a critical factor among methadone-related fatalities.

In contrast, a high abundance of co-ingested CNS depressants suggested that adverse effects from drug-drug interactions are more important risk factors for fatal outcome

# Vulnerability related to gene polymorphism: Near-fatal tramadol cardiotoxicity in a *CYP2D6* ultrarapid metabolizer

- Ultrarapid metabolizer phenotype suggested by tramadol/M1 metabolic ratio
- Heterozygous for duplicated wt allele predictive of *CYP2D6* ultrarapid metabolizer phenotype
- + Ketoconazole at inhibitory concentration of *CYP3A/CYPB6* (200 ng/ml)

# Naloxone: pharmacology properties

- Pure opioid antagonist at mu (high affinity), kappa, and delta receptors
- No agonist properties
- High first-pass metabolism (poor oral bioavailability)
- Short-plasma half-life 50 min
- Duration of action: 1-4 h
- Administered IV, IM, SC, IN

Widely used to reverse opioid toxicity

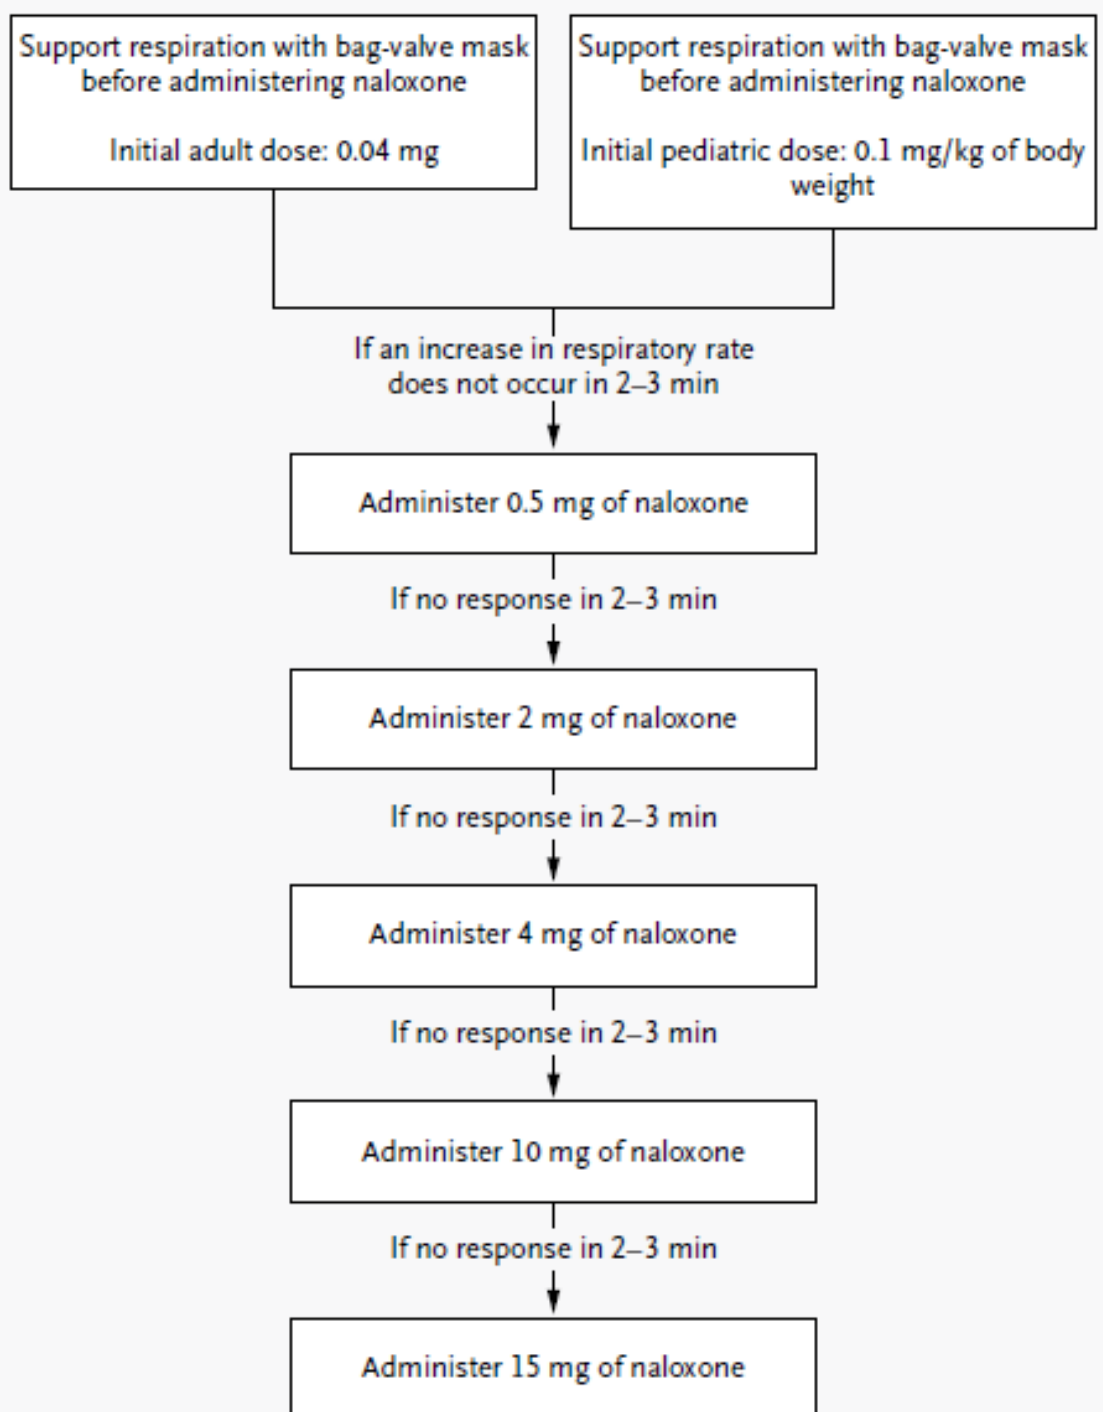

Dose-dependent reversal of opioid agonist effects

High dose may precipitate acute opioid withdrawal syndrome

# Naloxone Dosing

Total dose = 32 mg naloxone  
(i.e., 80 vials at 0.4 mg)

Boyer EW. *NEJM* 2012

# Comparison of heroin, methadone and BUP overdoses

	Heroin (N = 26)	Buprenorphine (N = 39)	Methadone (N = 19)	p
Suicide	12%	18%	58%	0.0007
Co-ingestions	73%	95%	89%	0.04
Glasgow Coma Score	5 [3 - 9]	7 [4 - 10]	4 [3 - 10]	0.1
Respiratory rate	10 [6 - 13]	12 [8 - 15]	10 [6 - 13]	0.4
SpO <sub>2</sub> (%)	82 [64 - 95]	94 [87 - 98]	91 [82 - 97]	0.05
pH	7.29 [7.17-7.34]	7.35 [7.24-7.38]	7.33 [7.23-7.42]	0.07
PaCO <sub>2</sub> (mmHg)	51 [45 - 55]	50 [45 - 66]	50 [36 - 57]	0.7
Mechanical ventilation	46%	41%	47%	0.6
Response to naloxone	81%	0%	71%	<0.0001
Response to flumazenil	0%	87%	60%	0.02

# Preventing opioid overdose deaths With take-home naloxone

- Death from opioid overdose occurs frequently at home, 1-3 h after exposure and often in the presence of bystanders (80%)
- BCLS by bystanders are generally not sufficient

Number of programs of naloxone distribution

Number of naloxone vials distributed over one year

Number of program participants

Number of reported opioid overdose reversals

136

140 053

152 283

26 463

# Conclusions

➔ Opioid overdose represents a challenging health concern worldwide

➔ **Toxicity** = CNS depression leading to asphyxic death

➔ **The reasons for the epidemic crisis:**

1- Increased availability with inadequate prescriptions

2- High risk of dependence and tolerance development

3- Genetic/non-genetic individual vulnerability

4- Emergence of the opioid NPS

➔ **Preventing opioid overdose deaths** is mandatory and could be achieved by maintenance treatments and take-home naloxone. New strategies based on preclinical findings and therefore with more uncertain timelines are under development.
